

Honeywell

CASE STUDY: HONEYWELL

When Honeywell's Australian Software Development Centre decided they needed an intranet to store and manage documentation effectively between their offices in Perth and Sydney, they began the development of their Microsoft Sharepoint Portal National Intranet.

“The Sharepoint Intranet will become a vital collaboration tool for our business...”

- Jim Volmer, Software Development Manager

Over a year in the making, the intranet was in final phases when they realised that navigation around the site was difficult and confusing. With over 150 highly critical portal users and potentially hundreds of team sites, it was essential that navigation be made simple to ensure its use and success.

The Vivid Group were called in with two main objectives.

The first was to design an attractive and inviting homepage that was user-friendly.

The second was to build a team site navigation component into the site to boost its functionality.

The homepage in essence had to encapsulate Honeywell's corporate image together with the employee friendly image of the software centre whilst at the same time make it appealing for users to explore. The information had to be orderly and have the capability for the latest news to stand out and grab people's attention.

The navigation tool was perhaps the most crucial part however. Without this the intranet would be virtually un-useable, as people wouldn't know where to go.

Complete, users on the portal will now be able to navigate across a hierarchy of team sites within departments, find documents and procedures easily and collaborate effectively with their colleagues. Management will have a tool to disseminate information at the touch of a button and ensure all employees receive internal messages.

The essential additions from Vivid now ensures that the intranet is of a professional standard and will have a much higher level of acceptance amongst the users.
